

TECHNICAL ARCHITECTURE

To implement a CRM for result tracking of a candidate with internal marks, you will need to consider the following technical architecture:

Infrastructure

- Web servers to host the CRM application
- Database servers to store the CRM data
- Application servers to run the CRM application
- Load balancers to distribute traffic across the web servers
- Firewalls to protect the CRM system from unauthorized access
- Networking infrastructure to connect all of the components

Software

- CRM application
- Vulnerability management Database software
- Operating system software
- Programming languages and frameworks
- Middleware software

Integration

- Integration with the company's internal systems, such as HR system, recruitment system, and learning management system

Security

- Data encryption
- Access control
- User authentication
